Implement Client Script & UI Policy (Incident)

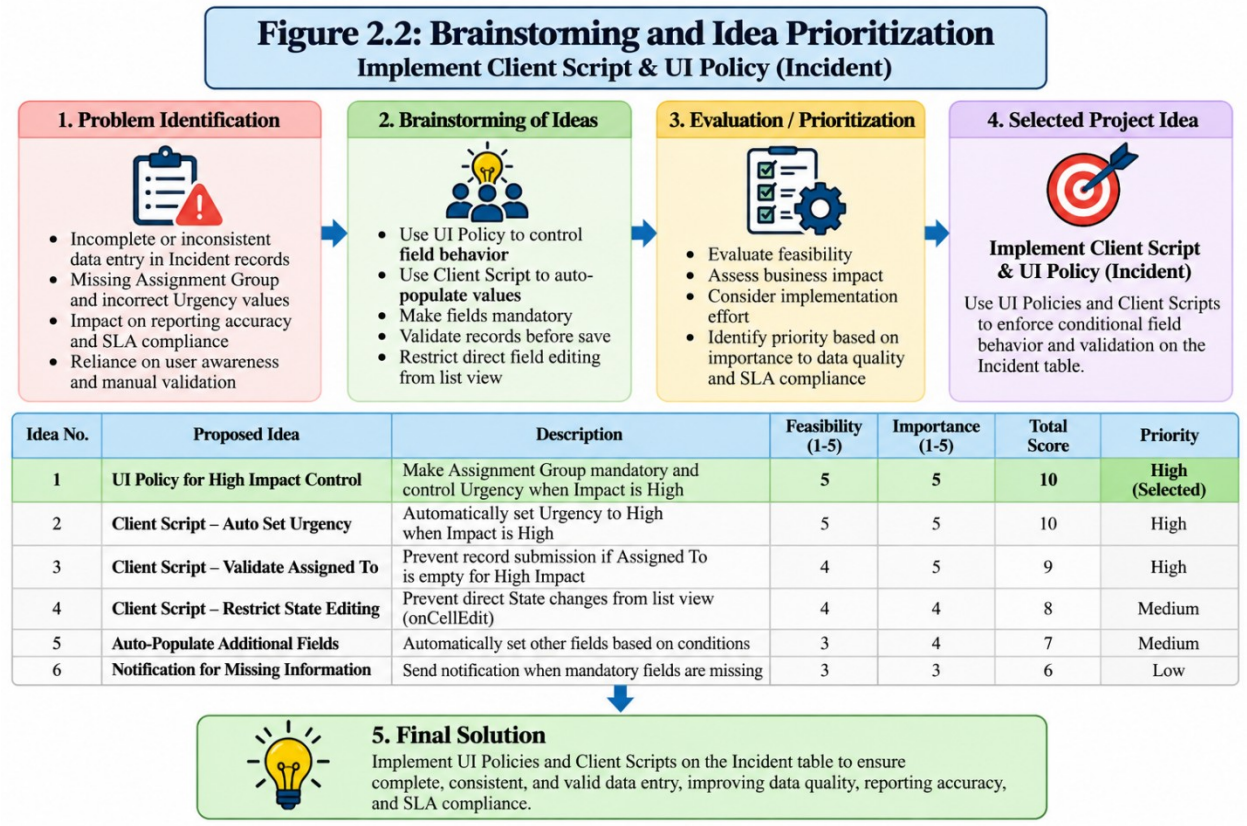

Figure 2.1: Ideation Diagram for Implement Client Script & UI Policy (Incident)

The ideation process identifies the need to improve Incident data consistency and proposes UI Policies and Client Scripts to enforce conditional field behavior and validation. The project focuses on High Impact Incident controls, mandatory Assignment Group handling, Urgency control and automation, Assigned To validation, and State editing restrictions.

Ideation Diagram

The **Ideation Diagram** illustrates the working approach of the **Implement Client Script & UI Policy (Incident)** project, starting from the identification of problems such as incomplete or inconsistent Incident data and the need for controlled field behavior. The team proposes using **UI Policies** and **Client Scripts** to address these issues. The UI Policy applies controls when **Impact is High**, including making **Assignment Group mandatory** and **Urgency read-only**, while Client Scripts provide automatic Urgency updates, Assigned To validation during submission, and restriction of direct State editing from the list view. These combined controls help ensure consistent, validated, and accurate Incident records in ServiceNow.
