ProjectName	**Implement Client Script & UI Policy (Incident)**
Maximum Marks	3 Marks

Implement Client Script & UI Policy (Incident)

Project-Level Access Control Matrix

The source project specifies administrator/configuration access for implementing the ServiceNow configuration. It does not document individual ACL records created in the instance; therefore, this matrix is a project-level role/access description rather than a list of verified ACL records.

Role	Create/Configure	View Incident	Update Incident	List Edit State
System Administrator / Configurator	Yes	Yes	Yes	Controlled by Client Script
Incident Manager	No configuration	Yes	Yes	Subject to configured rules
Service Desk Agent	No configuration	Yes	Yes	State list edit restricted
End User	No configuration	As permitted	As permitted	Restricted by configuration

The following is a **project-level access-control matrix** for the ServiceNow Incident project. The uploaded project content confirms administrator/configuration access, but it does **not** provide specific ACL records, ACL names, or verified role assignments. Therefore, the matrix below should be treated as a **role-based project planning matrix**, not as evidence of ACLs actually created in the ServiceNow instance.

ACL Matrix Description

The ACL matrix defines the intended access boundaries for the **Implement Client Script & UI Policy (Incident)** project. The System Administrator is responsible for configuring the UI Policy and Client Scripts, while Incident Managers and Service Desk Agents can work with Incident records according to the configured permissions. The project also controls direct State modification through list editing using the **onCellEdit Client Script**, requiring users to open the Incident form for the controlled update process. The project source specifically establishes administrator/configuration access and the use of Client Scripts for controlling Incident behavior; it does not document individual ACL records created in the instance.
