ProjectName	**Implement Client Script & UI Policy (Incident)**
Maximum Marks	3 Marks

System Architecture
Implement Client Script & UI Policy (Incident)

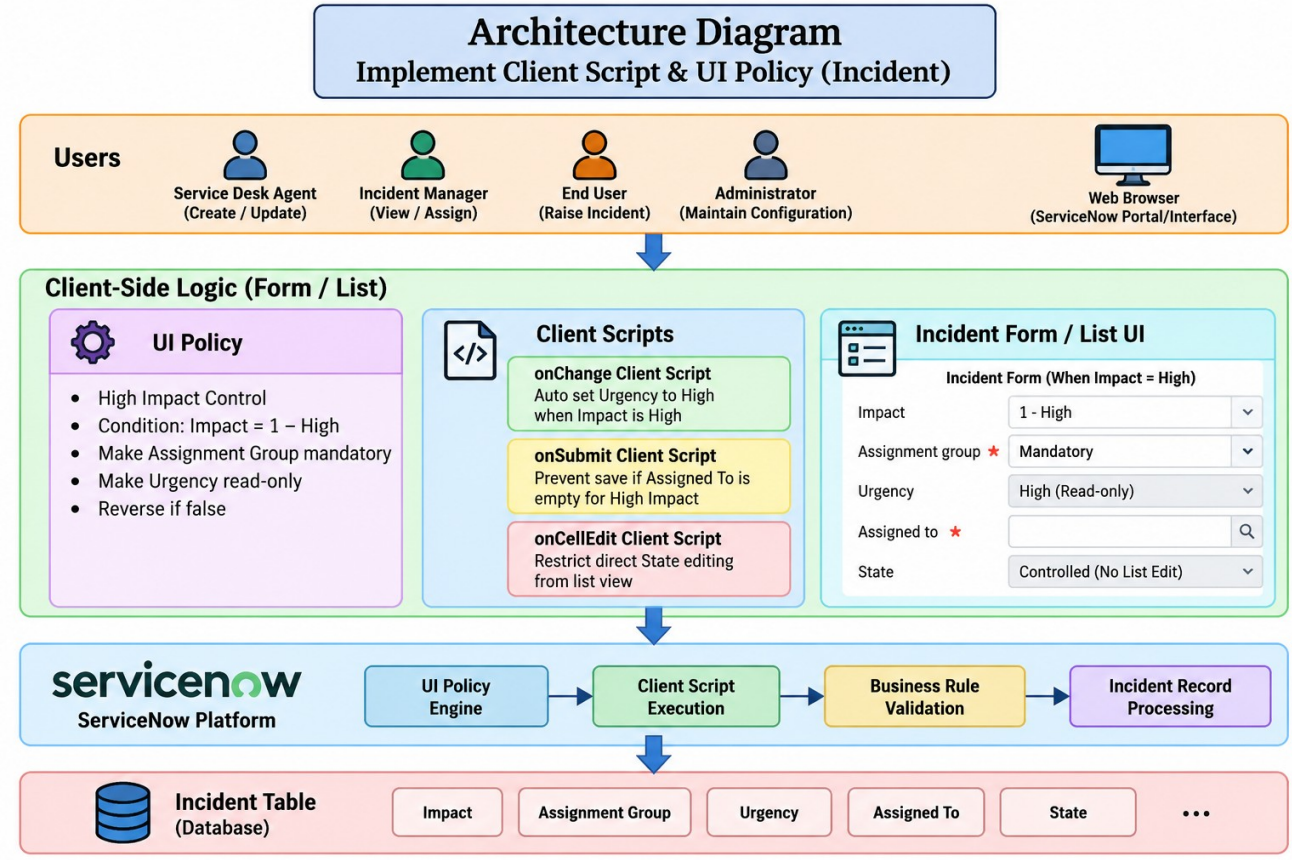

Figure 3.1: System Architecture for Implement Client Script & UI Policy (Incident)

The architecture shows users interacting with the Incident form and list interface. UI Policy controls are applied when Impact is High, while onChange, onSubmit and onCellEdit Client Scripts provide automatic updates, validation, and list-edit restrictions. The resulting controlled information is processed against the Incident table.

Architecture

The architecture of the proposed ServiceNow Incident Management solution consists of the **User Interface, UI Policies, Client Scripts, Incident Form, and Incident Database**. When a user interacts with the Incident form, UI Policies dynamically control field behavior based on conditions such as **Impact = High**. Client Scripts perform client-side validation and automation, including automatically setting Urgency, validating the Assigned To field before submission, and restricting State updates through list editing. The validated Incident information is then stored in the ServiceNow Incident database, ensuring consistent and controlled Incident data management.
