Implement Client Script & UI Policy (Incident)

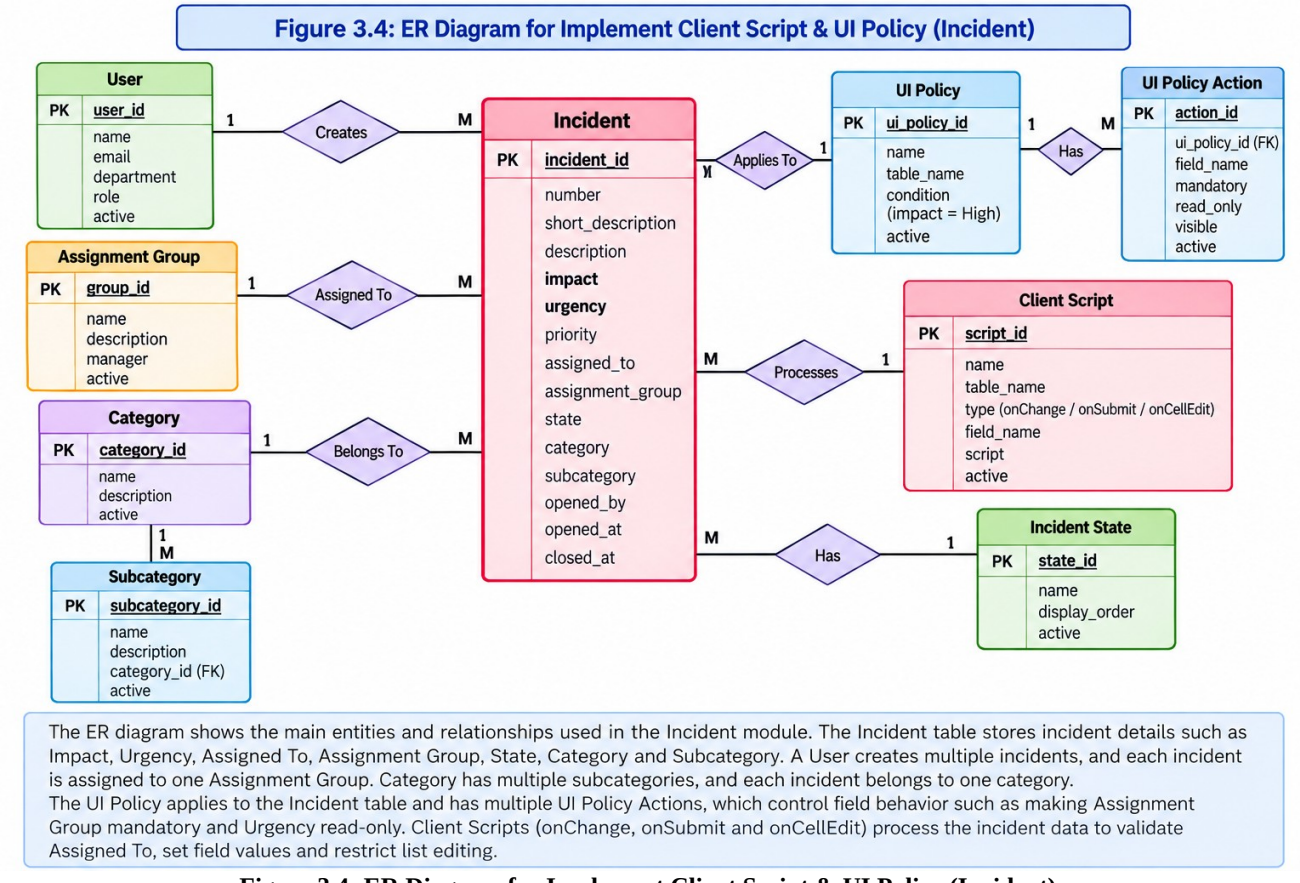

Figure 3.4: ER Diagram for Implement Client Script & UI Policy (Incident)

The ER diagram presents the main Incident data elements used by the project, including Impact, Assignment Group, Urgency, Assigned To and State, and their relationship to the Incident record and configuration rules.

Entity Relationship Diagram

The Entity Relationship Diagram represents the main entities involved in the **ServiceNow Incident Management** project and the relationships between them. The central entity is the **Incident**, which contains important information such as Incident Number, Impact, Urgency, Assignment Group, Assigned To, and State. The **User** entity represents the person who creates or manages the Incident, while the **Assignment Group** entity represents the group responsible for handling the Incident. The Incident is associated with an assigned user and an assignment group for proper incident processing.

The **UI Policy** and **Client Script** entities represent the configuration components that control the behavior and validation of Incident fields. UI Policies dynamically control field properties based on conditions, while Client Scripts perform client-side actions such as automatically setting Urgency, validating Assigned To before submission, and restricting State updates through list editing. Implement Client Script & UI Po… Implement Client Script & UI Po…

Main Relationships

Entity	Relationship	Related Entity
User	Creates/Updates	Incident
Assignment Group	Handles	Incident
User	Assigned To	Incident
Incident	Controlled By	UI Policy
Incident	Validated/Automated By	Client Script
Client Script	Performs	Validation & Automation

The ER diagram therefore provides a logical representation of how Incident records are associated with users, assignment groups, UI Policies, and Client Scripts. These relationships support the project's objective of maintaining consistent Incident information through dynamic field control and client-side validation.
