Reverse Condition Test

Date	2-October- 2026
TeamID	6ab46978b5170a9b58b3f461
ProjectName	**Implement Client Script & UI Policy (Incident)**
Maximum Marks	3 Marks

Reverse Condition Test

- **Urgency** should now be editable, meaning the read-only UI l reversed.

4. **Save the Record:**
   Click **Submit** to save the changes. The record should save successfi confirming that the reverse condition works as intended.

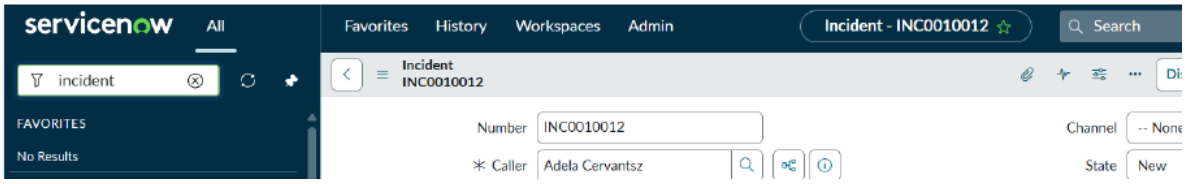

Figure: Reverse Condition Test – Incident Form

The screenshot demonstrates the Reverse Condition Test for the Incident form. An existing Incident is opened with the Impact field initially set to High, and the Impact value is then changed from High to Medium. This test is designed to verify the Reverse if false functionality of the UI Policy and the related Client Script behavior.

After the Impact value is changed to Medium, the Assigned To field should no longer be mandatory. The screenshot also shows the Incident form with Impact set to Medium and the Urgency field available for editing. This confirms the expected reversal of the UI Policy behavior when the original High Impact condition is no longer satisfied.

The record is then submitted to confirm that the changed configuration operates correctly without errors. According to the project procedure, successful saving confirms that the reverse condition is functioning as intended. The test therefore verifies that the UI Policy can apply its controls when Impact is High and appropriately restore normal field behavior when the condition changes.
