Successful Save

Date	2-October- 2026
TeamID	6ab46978b5170a9b58b3f461
ProjectName	**Implement Client Script & UI Policy (Incident)**
Maximum Marks	3 Marks

Successful Save – Incident Validation

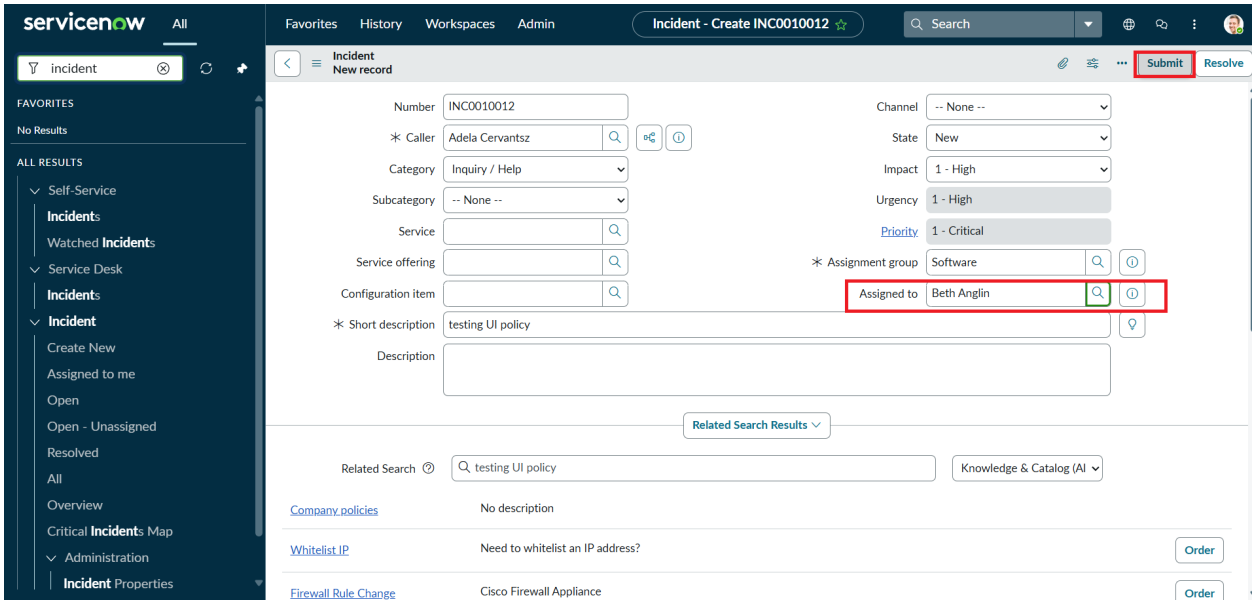

Figure: Successful Save Test for the Incident Record

The screenshot above demonstrates the successful save test performed on an Incident record after the required fields were completed. The Incident form shows Impact set to “1 - High”, an Assignment group selected, and an Assigned to user populated. The Submit button is available, indicating that the record has the required information for the configured validation to proceed.

This test verifies the onSubmit Client Script behavior described in the project. When the Assigned To field is populated, the condition that prevents saving an Incident with High Impact and an empty Assigned To field is no longer satisfied. As a result, the Incident can be submitted successfully without displaying the validation error.

The successful save test also confirms the interaction of the other configured controls. The Urgency field is displayed as “1 - High” and remains read-only under the High Impact UI Policy, while the Assignment group and Assigned To information are populated on the Incident form. Together, these results demonstrate that the UI Policy and Client Script configurations are working as intended during a valid Incident submission.
