ProjectName	**Implement Client Script & UI Policy (Incident)**
Maximum Marks	3 Marks

Test Cases – UI Policy and Client Script Configuration

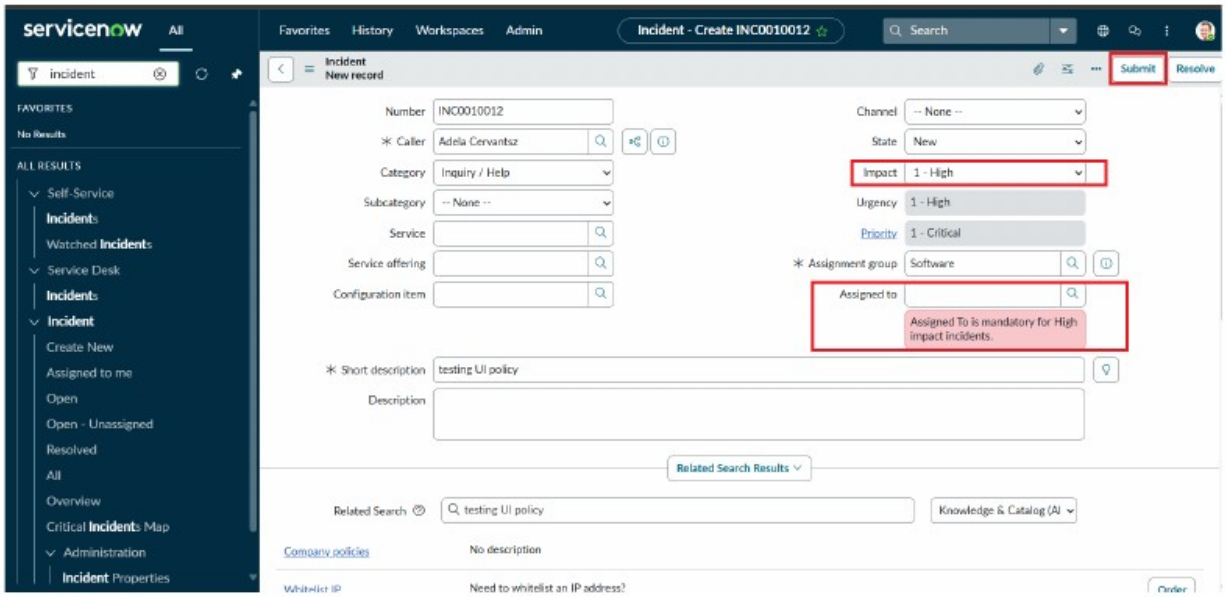

Figure: Test Case – High Impact Incident Mandatory Enforcement

The test case shown above verifies the mandatory enforcement configured for high-impact Incident records. The Impact field is set to High and the Assigned To field is left empty before the user attempts to submit the Incident. This test is designed to confirm that the configured onSubmit Client Script correctly validates the required information before the record can be saved.

When the Incident is submitted without an Assigned To value, the configuration should prevent the record from being saved and display an error message indicating that Assigned To is mandatory for High impact incidents. The test also confirms that the related UI Policy behavior, including the configured field controls and automated urgency behavior, is applied as expected. These checks correspond to the testing procedure in the source project.

The test case demonstrates that the combination of UI Policies and Client Scripts provides effective validation at the Incident form level. By testing the High Impact condition with incomplete assignment information, the configuration can be verified for data completeness and correct user guidance. The source project further defines successful-save, reverse-condition, list-edit blocking, and form-based update tests as additional validation activities.
