ProjectName	**Implement Client Script & UI Policy (Incident)**
Maximum Marks	3 Marks

Screenshot 1: UI Policy – High Impact Control Configuration

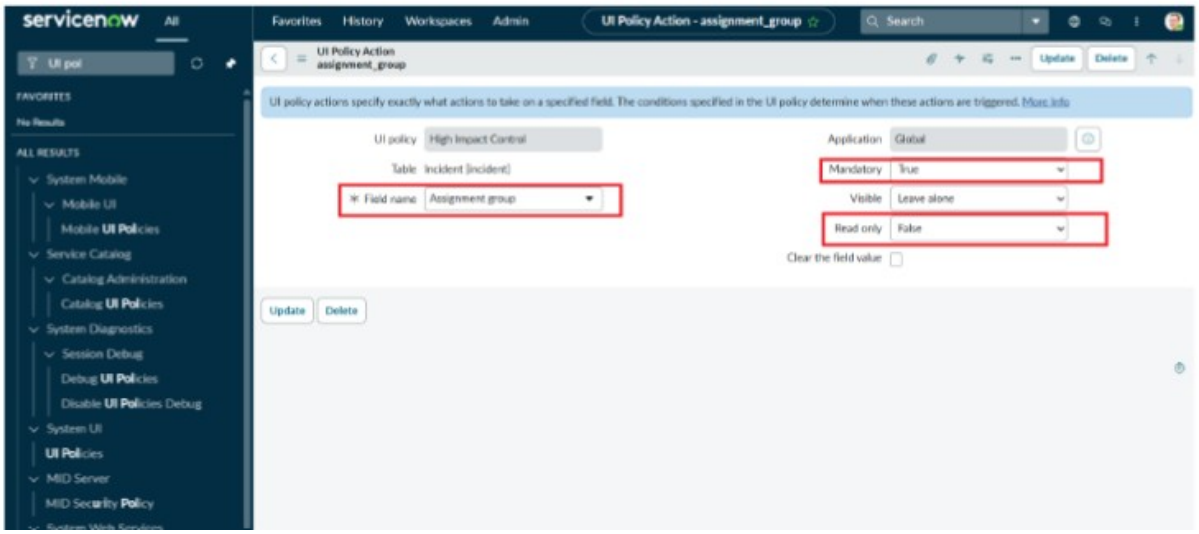

This screenshot shows the **High Impact Control** UI Policy configured for the Incident table. The condition is set to **Impact = 1 – High**, with Assignment Group configured as mandatory. The configuration demonstrates dynamic control of Incident fields based on Impact.

Test Screenshots

Screenshot 2: UI Policy Action – Urgency Read-Only Configuration

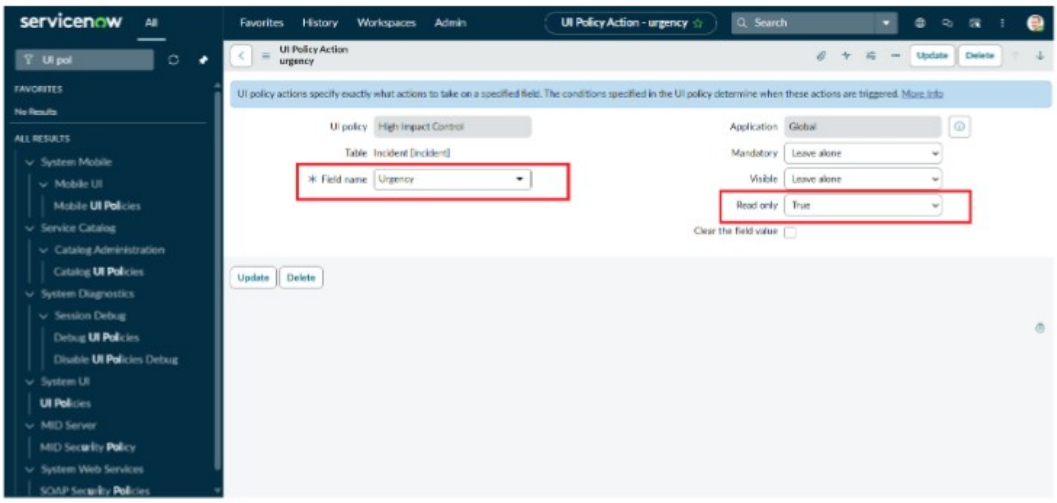

This screenshot shows the UI Policy Action configured for the **Urgency** field. The **Read-only** option is enabled so that Urgency cannot be modified when Impact is High. The field remains visible while its editing behavior is controlled by the policy. Implement Client Script & UI Po…

Screenshot 3: UI Policy Action – Verification

This screenshot demonstrates the configured UI Policy Action associated with the Incident form. When the Impact condition is satisfied, the Urgency field is controlled according to the configured action. The configuration also supports reversing the field behavior when the condition becomes false.

Test Screenshots

Screenshot 4: onChange Client Script – Auto Set Urgency

This screenshot shows the **onChange Client Script** configured for the Impact field.
When Impact is changed to High, the script automatically sets the Urgency value to High.
An information message is also displayed to inform the user about the automatic update.

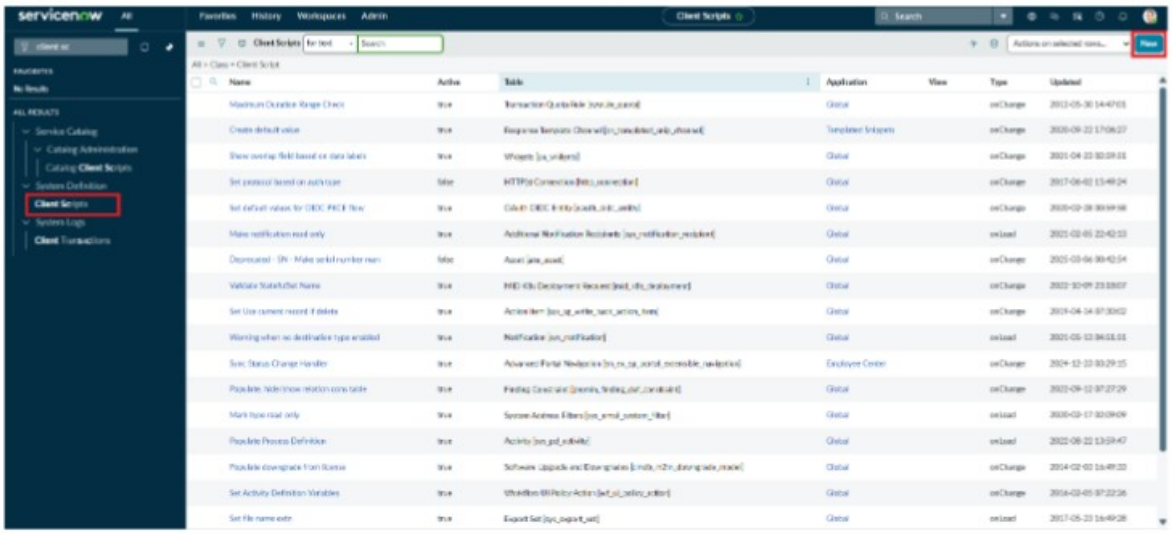

Screenshot 5.: onSubmit Client Script – Save Validation

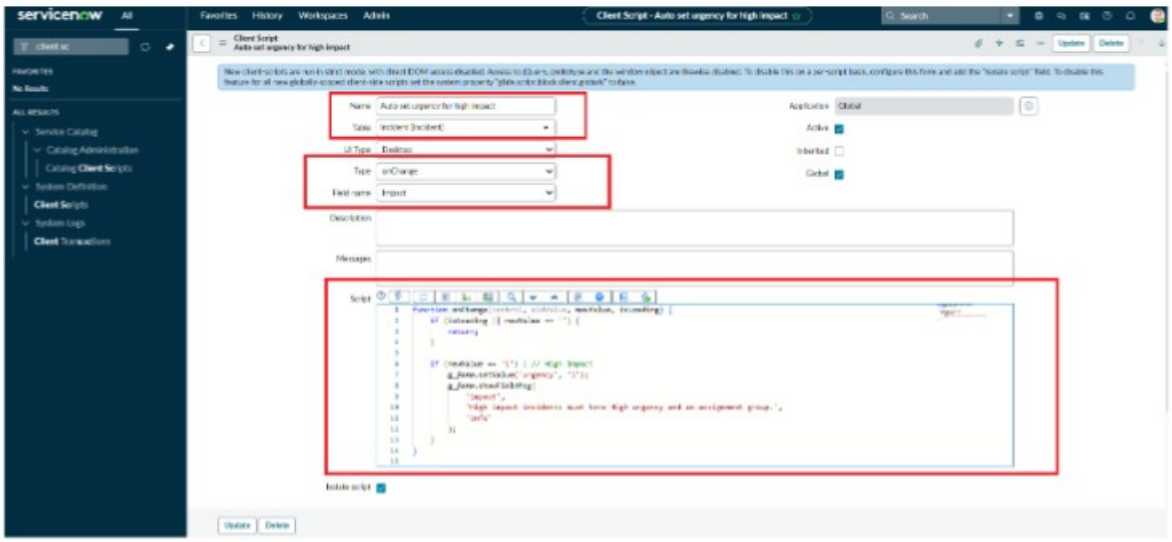

This screenshot shows the **onSubmit Client Script** configured for the Incident table.
The script checks whether Assigned To is empty when the Impact is High.
If the required condition is not satisfied, the Incident submission is prevented and an error is displayed. Implement Client Script & UI Po…

Screenshot 6: onCellEdit Client Script – State List Editing Restriction

This screenshot shows the **onCellEdit Client Script** configured for the State field.
The script prevents users from changing State directly through Incident list editing.
Users are instructed to open the Incident form to perform the State update.

Test Screenshots

6. Project Testing Screenshots

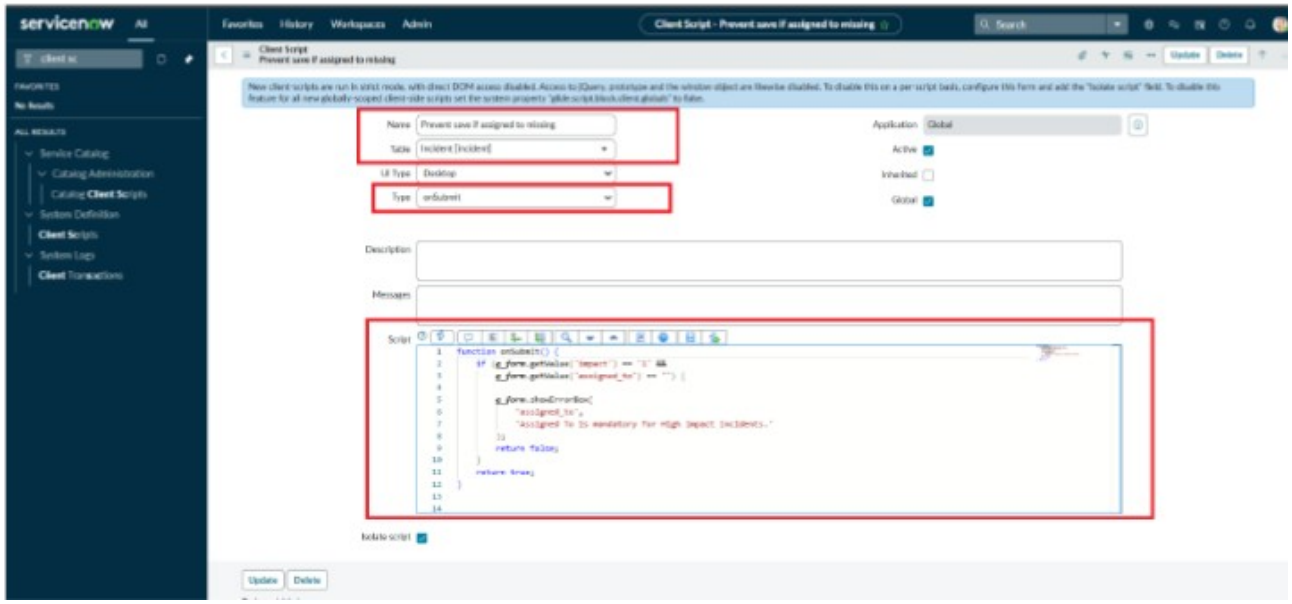

Screenshot 7: Mandatory Validation Test – Assigned To

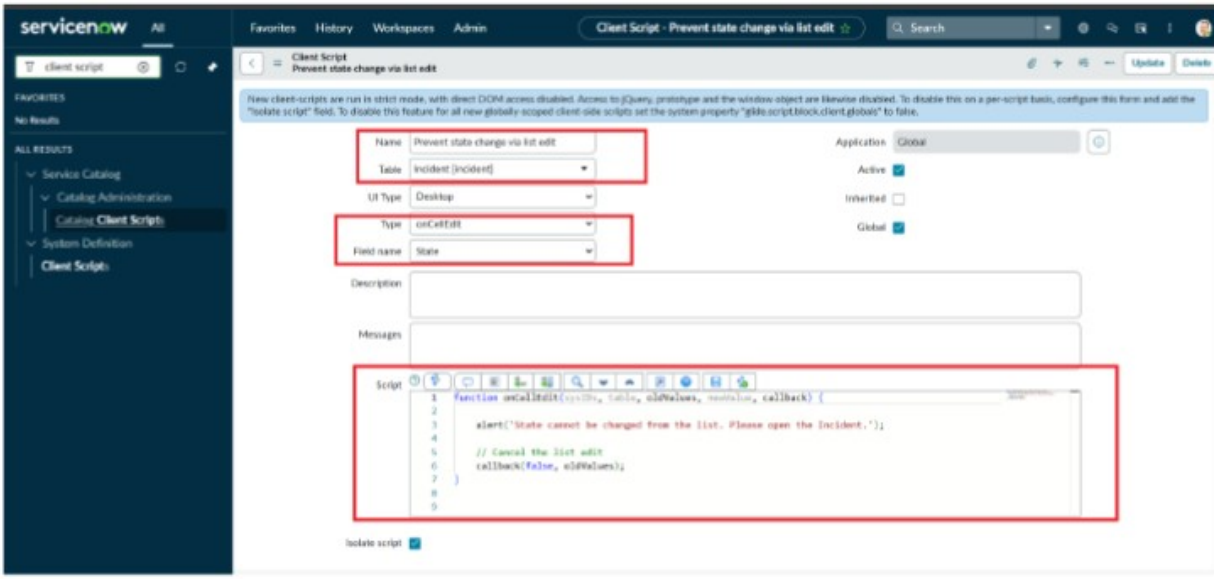

This screenshot demonstrates testing with **Impact set to High** while Assigned To is left empty.
The configuration is tested by attempting to submit the Incident record.
The expected result is that the record is not saved because Assigned To is required. Implement Client Script & UI Po…

Screenshot 8: Mandatory Validation Error Result

This screenshot shows the Incident form after the mandatory validation test.
The system indicates that the Incident should not be saved when Assigned To is empty for High Impact.
The screenshot also verifies the configured UI Policy and automated field behavior.

Test Screenshots

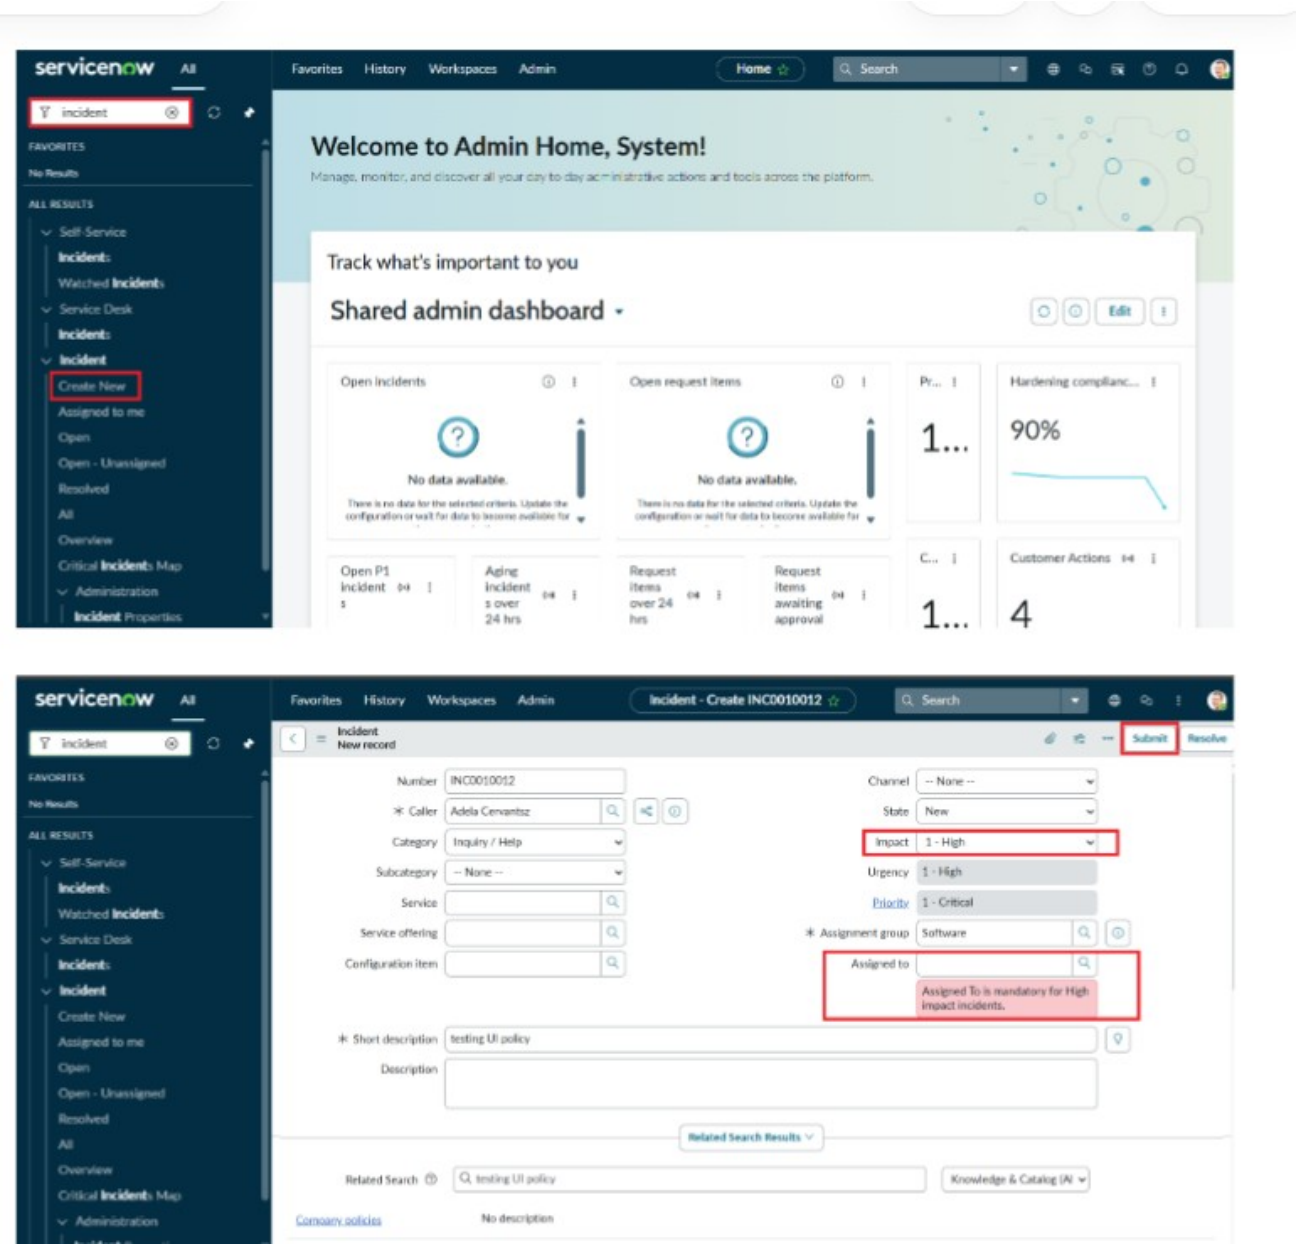

Screenshot 9: Successful Incident Save

This screenshot demonstrates a successful Incident submission after providing the required Assigned To information.
The Incident record is saved without validation errors.
The configured Urgency automation, read-only behavior, and State restrictions are also verified.
Implement Client Script & UI Po…

Test Screenshots

Screenshot 10: Reverse Condition Test

This screenshot demonstrates the **Reverse if false** behavior of the UI Policy.
The Impact value is changed from High to Medium to test whether the configured restrictions are reversed.
Assigned To is no longer mandatory and the Urgency field becomes editable.

Screenshot 11: Successful Incident Save

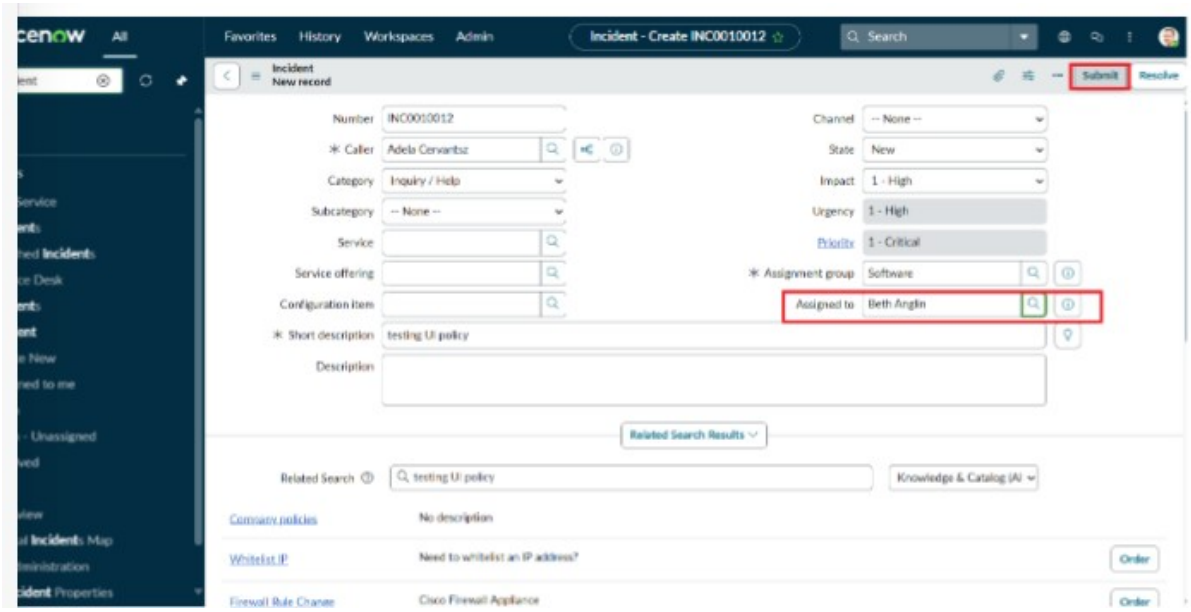

This screenshot demonstrates a successful Incident submission after providing the required Assigned To information.The Incident record is saved without validation errors.

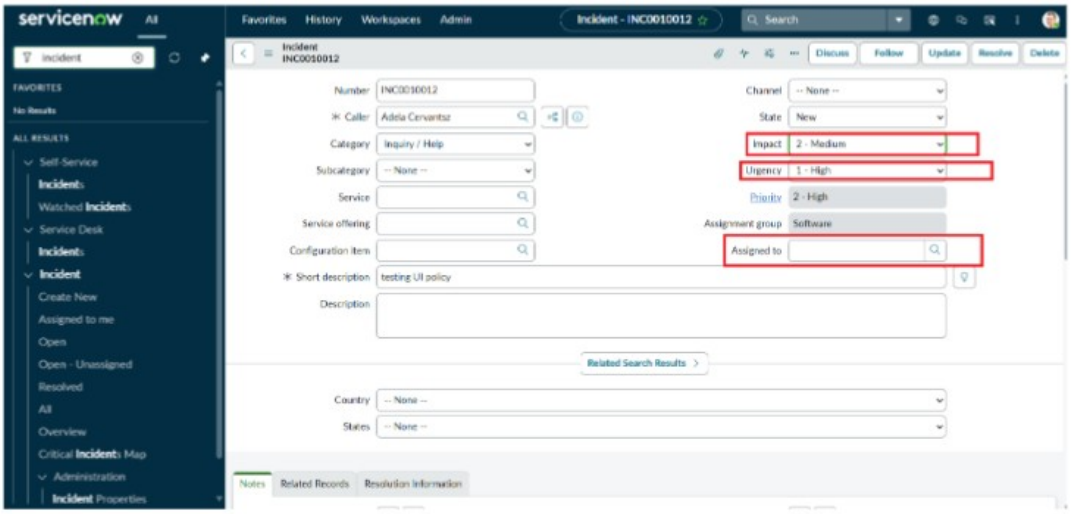

Test Screenshots

The configured Urgency automation, read-only behavior, and State restrictions are also verified.
Implement Client Script & UI Po…

Screenshot 12: Reverse Condition Test

This screenshot demonstrates the **Reverse if false** behavior of the UI Policy.
The Impact value is changed from High to Medium to test whether the configured restrictions are reversed.Assigned To is no longer mandatory and the Urgency field becomes editable.

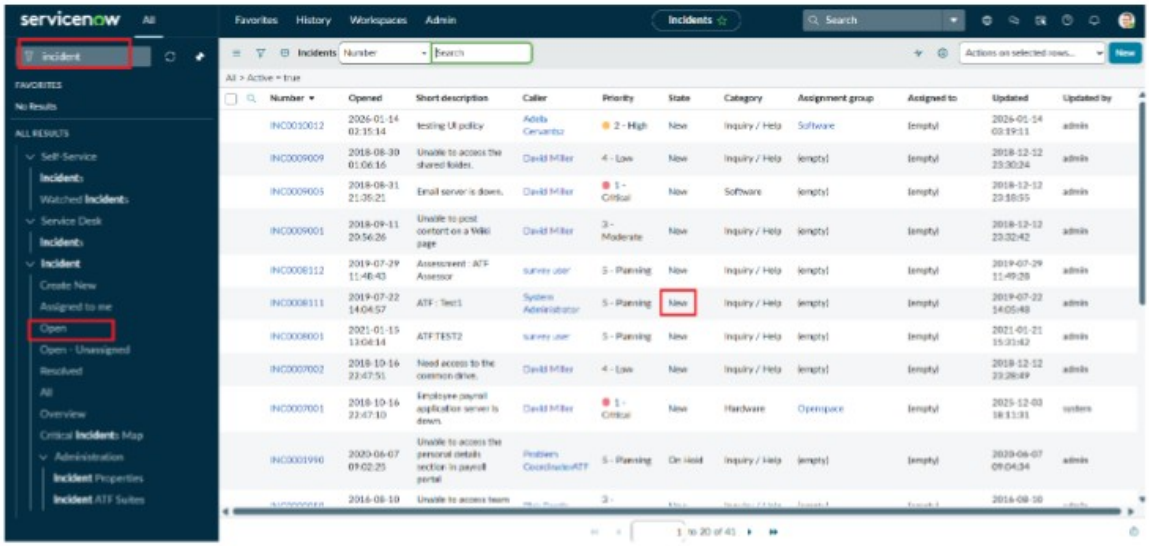

Test Screenshots

Screenshot 13: Incident List – State List Edit Test

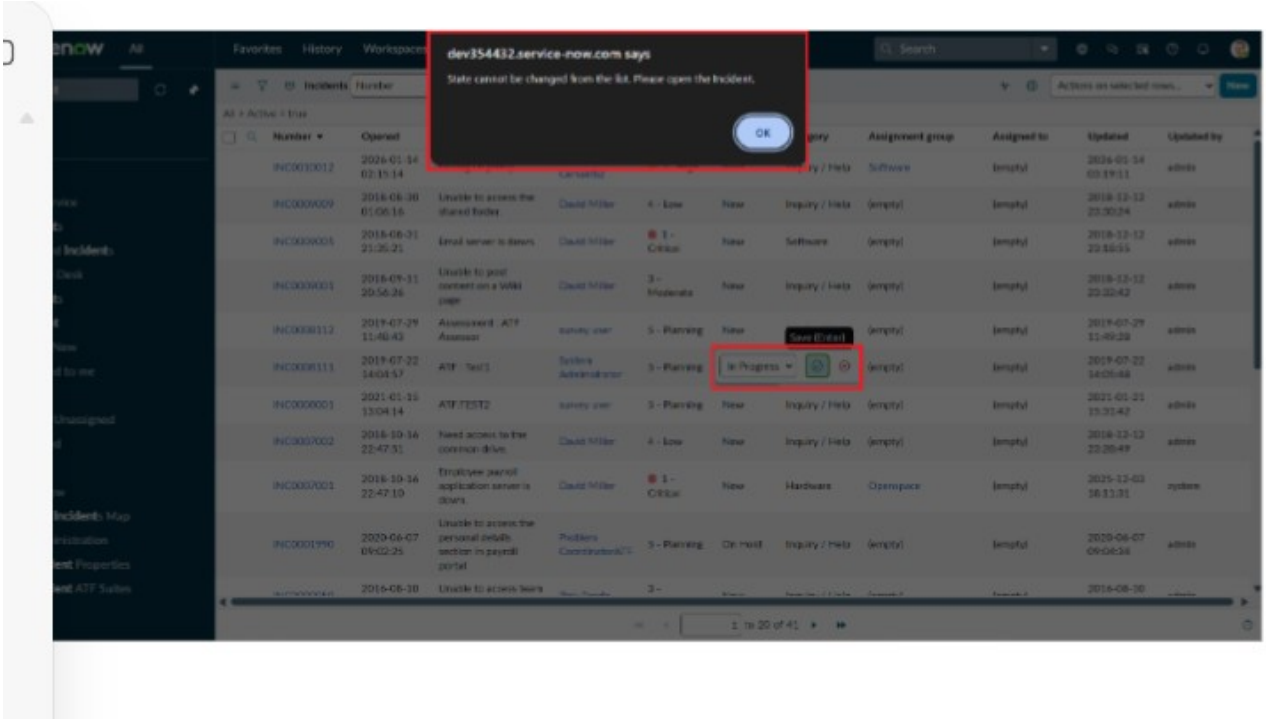

This screenshot shows the Incident list where a user attempts to edit the **State** field directly. The list-edit operation is used to test the onCellEdit Client Script. The test verifies that direct State modification through the list is restricted. Implement Client Script & UI Po…

Screenshot 14: onCellEdit Blocking Alert

This screenshot shows the alert message generated when a user attempts to change State through list editing. The message instructs the user to open the Incident instead of editing State directly in the list. The State value remains unchanged, confirming that the onCellEdit script blocks the operation.

Test Screenshots

Screenshot 15: Form-Based State Update

This screenshot demonstrates updating the **State** field through the Incident form.
Unlike list editing, the form-based State update is allowed by the configured Client Script.
The screenshot confirms that the Incident can be updated while the other configured rules remain active. Implement Client Script & UI Po…

Screenshot 16: Final Incident Form and List Verification

This screenshot provides additional visual verification of the configured Incident form and Incident list.It shows the project configuration working across the form and list interfaces.
The evidence supports the final testing and demonstration of the Client Script and UI Policy implementation.
