ProjectName	**Implement Client Script & UI Policy (Incident)**
Maximum Marks	3 Marks

Demo Project – Implement Client Script & UI Policy (Incident)

1. Project Introduction

The **Implement Client Script & UI Policy (Incident)** project demonstrates how ServiceNow can be configured to control Incident form behavior and improve data consistency. The project combines **UI Policies, UI Policy Actions, and Client Scripts** to control fields dynamically, automate values, validate information, and restrict inappropriate list-based updates. Implement Client Script & UI Po…

2. Project Objective

The main objective of the project is to enforce appropriate business rules on Incident records through client-side configuration. When an Incident has **Impact = 1 – High**, the system applies specific controls such as making **Assignment Group mandatory** and controlling the **Urgency** field. Implement Client Script & UI Po…

3. Main Features Demonstrated

3.1 High Impact UI Policy

The **High Impact Control** UI Policy is created for the **Incident** table. Its condition is:

Impact → is → 1 – High

When the condition is satisfied, the configured UI Policy Actions are applied to the Incident form. Implement Client Script & UI Po…

3.2 Assignment Group Mandatory

When Impact is High, the **Assignment Group** field becomes mandatory. The **Reverse if false** option allows the field behavior to return to its normal state when the Impact condition is no longer satisfied. Implement Client Script & UI Po…

Demo Project

3.3 Urgency Read-Only

A UI Policy Action is configured for the **Urgency** field. When Impact is High, Urgency is made **read-only**, while the field remains visible on the Incident form. Implement Client Script & UI Po…

3.4 onChange Client Script

The **onChange Client Script** runs when the Impact field changes. If the new Impact value is High, the script automatically sets Urgency to High and displays an information message. Implement Client Script & UI Po…

3.5 onSubmit Client Script

The **onSubmit Client Script** validates the Assigned To field before saving. If Impact is High and Assigned To is empty, the Incident is not submitted and an error message is displayed. Implement Client Script & UI Po…

3.6 onCellEdit Client Script

The **onCellEdit Client Script** prevents users from changing the State field directly through Incident list editing. The user is instructed to open the Incident form to perform the State update. Implement Client Script & UI Po…

4. Demo Procedure

Step 1: Open the Incident Form

Open the ServiceNow Incident module and create or open an Incident record.

Step 2: Set Impact to High

Change the **Impact** field to:

1 – High

This triggers the configured UI Policy and Client Script behavior.

Step 3: Verify Assignment Group

Observe that **Assignment Group** becomes mandatory because the High Impact UI Policy is active.

Step 4: Verify Urgency

The **Urgency** field is automatically set to High through the onChange Client Script and is controlled as read-only by the UI Policy Action.

Demo Project

Step 5: Test Assigned To Validation

Leave **Assigned To** empty and click **Submit**.

The onSubmit Client Script should prevent the Incident from being saved and display the validation message. Implement Client Script & UI Po…

Step 6: Test Successful Submission

Enter a valid user in **Assigned To** and click **Submit**.

The Incident should save successfully when the required condition is satisfied. Implement Client Script & UI Po…

Step 7: Test Reverse Condition

Change Impact from **High** to **Medium**.

The Assignment Group should no longer be mandatory and the Urgency read-only behavior should be reversed according to the UI Policy configuration. Implement Client Script & UI Po…

Step 8: Test List Editing

Open the Incident list and attempt to change **State** directly using list editing.

The onCellEdit Client Script displays an alert and prevents the list-based State update. Implement Client Script & UI Po…

Step 9: Test Form-Based State Update

Open the Incident form and change the **State** field from the form.

The State update is allowed through the form and can be saved successfully.

5. Demo Conclusion

The demonstration shows how **UI Policies and Client Scripts work together** to control Incident form behavior. The project successfully demonstrates High Impact field control, automatic Urgency handling, Assigned To validation, reverse-condition behavior, and restriction of State changes through list editing. These configurations provide a practical example of improving data consistency and controlled user interaction in ServiceNow Incident Management.
